

The component directory has all the webpage displays.

- login: login page

- home: top anime gallery

- navbar: navigation on top of the pages

- animeSearch: gallery with filtering and searching by text

- animeProfile: See the basic info about the selected anime and the reviews. Can also add to my favorites.

The service has the 1 file that handles all the api requests. The component sends all the needed data to service and service can use the data to make the api request so no requests need to be made again.

ExpressJS will take the requests made by the service from the frontend and make a request to either the MongoDB or external API to get the data needed.

Lastly when the MongoDB or external API makes the response with its data, the data will travel to ExpressJS, service, and finally to the component which will then display the data.
